

Support and Infill

The homeowner selects the essential functions that he requires in a toilet (in this case). Due to the modular nature of the essential functions and the basic toilet module of 0.80 m by 1.60 m, any number of functions can be added inside the toilet. Along with amenities and the functions, the user also can decide upon the nature of opacity between different spaces/nature of the space by selecting the type of openings and the weather protections. Intention of this exercise is to have a whole set of modular elements ready for homeowners to choose and integrate in a support structure. By making connections between the size and structure of the family, activities done daily, privacy requirements, budget and other desires the modules can be selected and placed accordingly in a fairly flexible support structure.
